ITEM NO.	DESCRIPTION OF ITEM (With Inclusive Dates or Retention Periods)	9. SAMPLE OR JOB NO.	10. ACTION TAKEN
1	<p>Non Record Material -- The Mine Safety & Health Administration (MSHA) has in its files approximately six cubic feet of non record quarterly individual radon daughter exposure records from most underground uranium and four non-uranium underground mines, dating from mid-1974 to mid-1979.</p> <p>The subject records were mandated by 30 CFR 57.5-40(a), promulgated February 25, 1970, effective July 31, 1970, and superseded August 30, 1979:</p> <p>Where uranium is mined, if measurements in areas indicate exposure to concentrations of radon daughters in excess of 0.3 working level, complete individual exposure records shall be kept for all employees entering these areas.</p> <p>There were no provisions in the Federal regulation specifying how exposures were to be computed, where or for how long the records were to be kept, or submission to MSHA.</p> <p>MSHA obtained these records from three state mine regulatory agencies by virtue of the State Plan Agreement and from one other state by request. The records were used to: (1) summarize and report exposure to Congress, other Federal agencies, and the public, (2) compare operator reported exposure levels with Federal and State sampling</p>		<i>1 item</i>

results. Through this process, it was discovered that the subject records were inaccurate--they systematically underestimated employee exposure. Because of their inaccuracy, and because the individual operators are required to keep records to assure compliance with the four working level month per year exposure limit, MSHA has determined that the records they now have on hand have no historical or administrative value to the agency. We therefore request permission for one time disposal of these records.
